

DOCUMENTATION FOR INSTALLING GLPI ON A DEBIAN MACHINE:

PREREQUISITES:

- A PRE-INSTALLED DEBIAN MACHINE WITH ROOT PRIVILEGES.
- INTERNET ACCESS.
- SWITCH IN TO SUPER ADMIN MODE WITH THE COMMAND "SU"

START DOWN

FIRST STEP:

Before beginning the installation of GLPI, it is recommended to update your system to ensure that you have all the latest security updates. To do this, open a terminal and enter the following commands:

apt update
apt upgrade

```
root@GLPI:/home/user# apt upgrade
Lecture des listes de paquets... Fait
Construction de l'arbre des dépendances... Fait
Lecture des informations d'état... Fait
Calcul de la mise à jour... Fait
0 mis à jour, 0 nouvellement installés, 0 à enlever et 0 non mis à jour.
root@GLPI:/home/user# apt update
Atteint :1 http://deb.debian.org/debian bullseye InRelease
Réception de :2 http://security.debian.org/debian-security bullseye-security InRelease [48,4 kB]
Réception de :3 http://security.debian.org/debian-security bullseye-security/main Sources [193 kB]
Réception de :4 http://security.debian.org/debian-security bullseye-security/main amd64 Packages [236 kB]
477 ko réceptionnés en 1s (521 ko/s)
Lecture des listes de paquets... Fait
Construction de l'arbre des dépendances... Fait
Lecture des informations d'état... Fait
5 paquets peuvent être mis à jour. Exécutez « apt list --upgradable » pour les voir.
```

SECOND STEP:

INSTALLATION OF THE LAMP SERVER

For our LAMP server, we install apache2 as well as mariadb and php.

apt install apache2 mariadb-server php -y

Then we activate the apache2 and mariadb at the start of the machine.

systemctl enable apache2 mariadb

THIRD STEP:

INSTALLATION OF GLPI 10 :

GLPI needs perl as well as “a few” php extensions.

apt install perl -y

apt install php-ldap php-imap php-apcu php-xmlrpc php-cas php-mysqli php-mbstring php-curl php-gd php-simplexml php-xml php-intl php-zip php-bz2 -y

For the changes to take effect, reload apache.

systemctl reload apache2

Now we download the code of GLPI on the official site. You can find the link of the latest version of GLPI here:

<https://glpi-project.org/downloads>.

cd /tmp/ wget <https://github.com/glpi-project/glpi/releases/download/10.0.7/glpi-10.0.0.tgz>

We unzip the file and put it in the folder /var/www/html

tar xzf glpi-10.0.0.tgz -C /var/www/html

Now we change the permissions on the GLPI folder so that the Apache web server can access it:

chown -R www-data:www-data /var/www/html/glpi
chmod -R 775 /var/www/html/glpi

FOURTH STEP:

CREATION OF THE DATABASE

We use MariaDB for the database part (SQL). We create a database, a user and I give permission to the latter to work on our database.

mysql -u root

In the mariaDB terminal:

```
create database glpi;  
create user glpiuser@localhost identified by 'motdepasse';  
grant all privileges on glpi.* to glpiuser@localhost;  
flush privileges;  
exit;
```

MariaDB

LAST STEP:

GLPI INITIALIZATION

Go to a browser and go to the following address:

<http://ip-server/glpi>

- You should find yourself face to face with GLPI, you can select the language first.
- You will then have to accept the terms of the GLPI License.
- And click install.

A check of the prerequisites is done, everything is checked except for a small orange triangle in the middle. The error is normal, it was already the case on GLPI 10, you can continue the installation.

Connect to the database that glpi will use, just fill in the SQL user

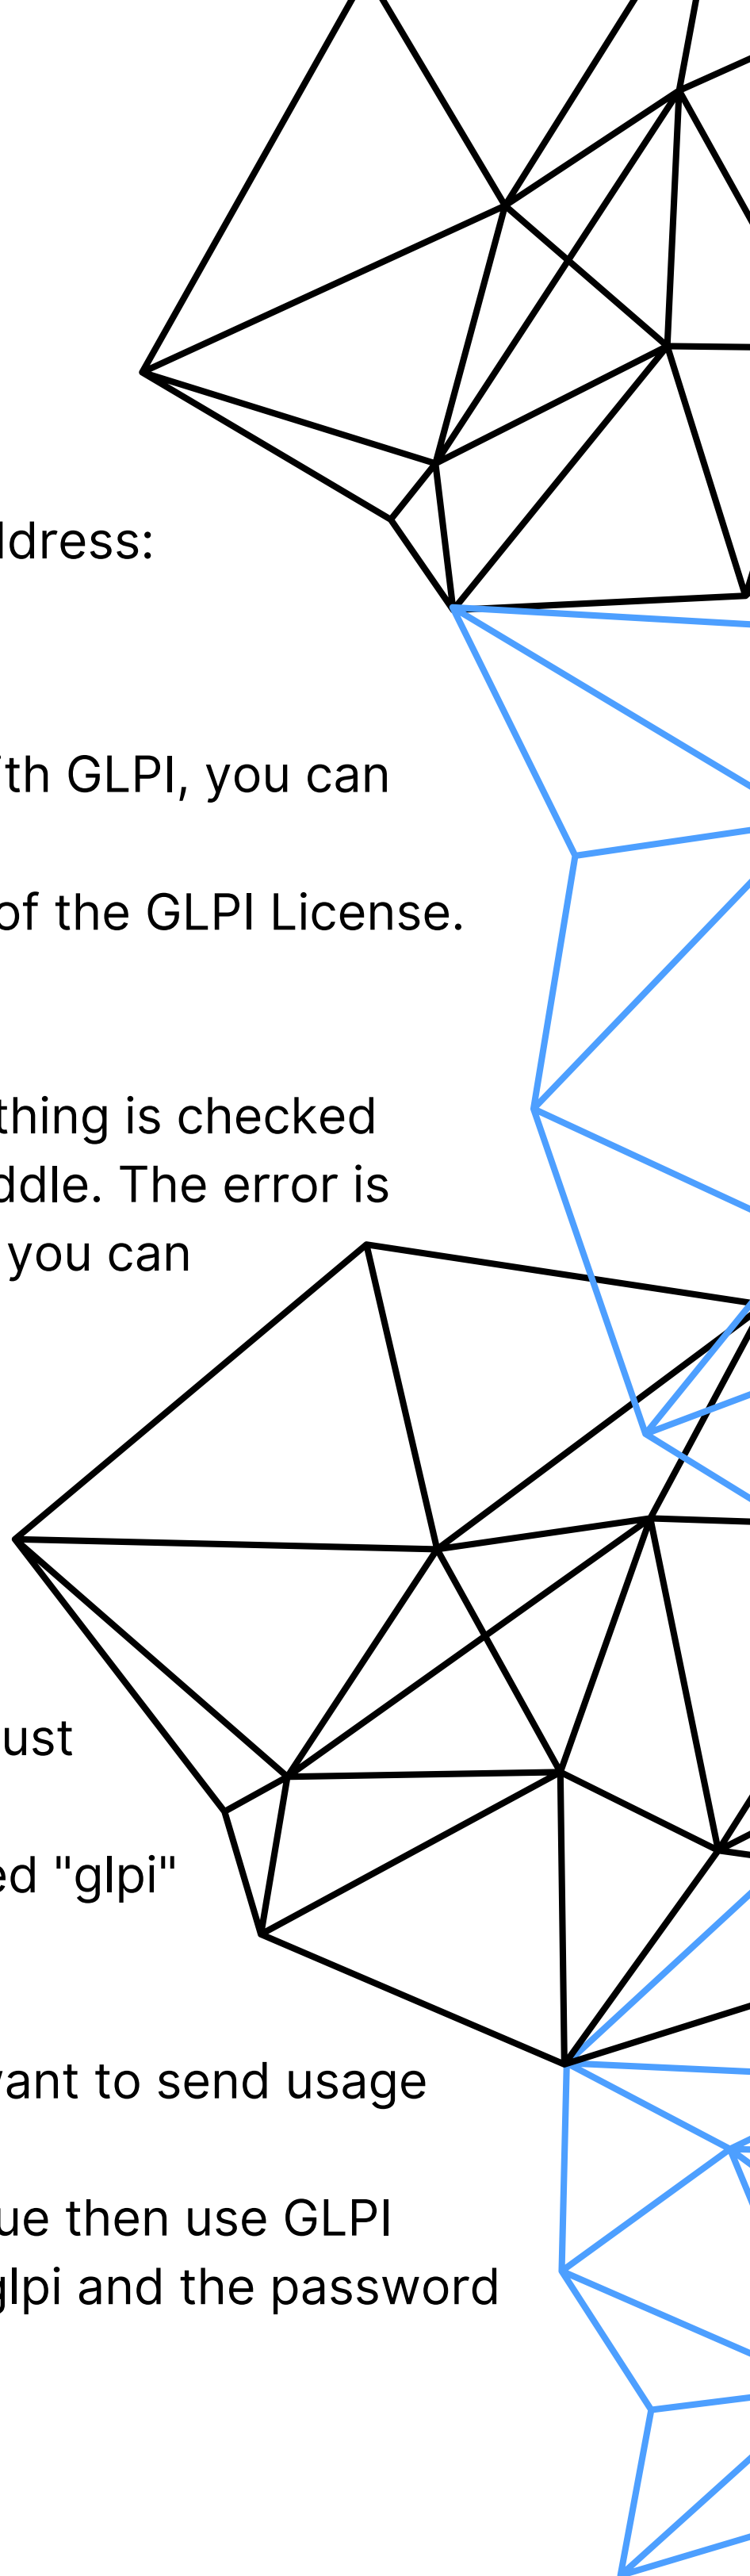

Once connected, select the database named "glpi" previously created.

Now, The database initializes.

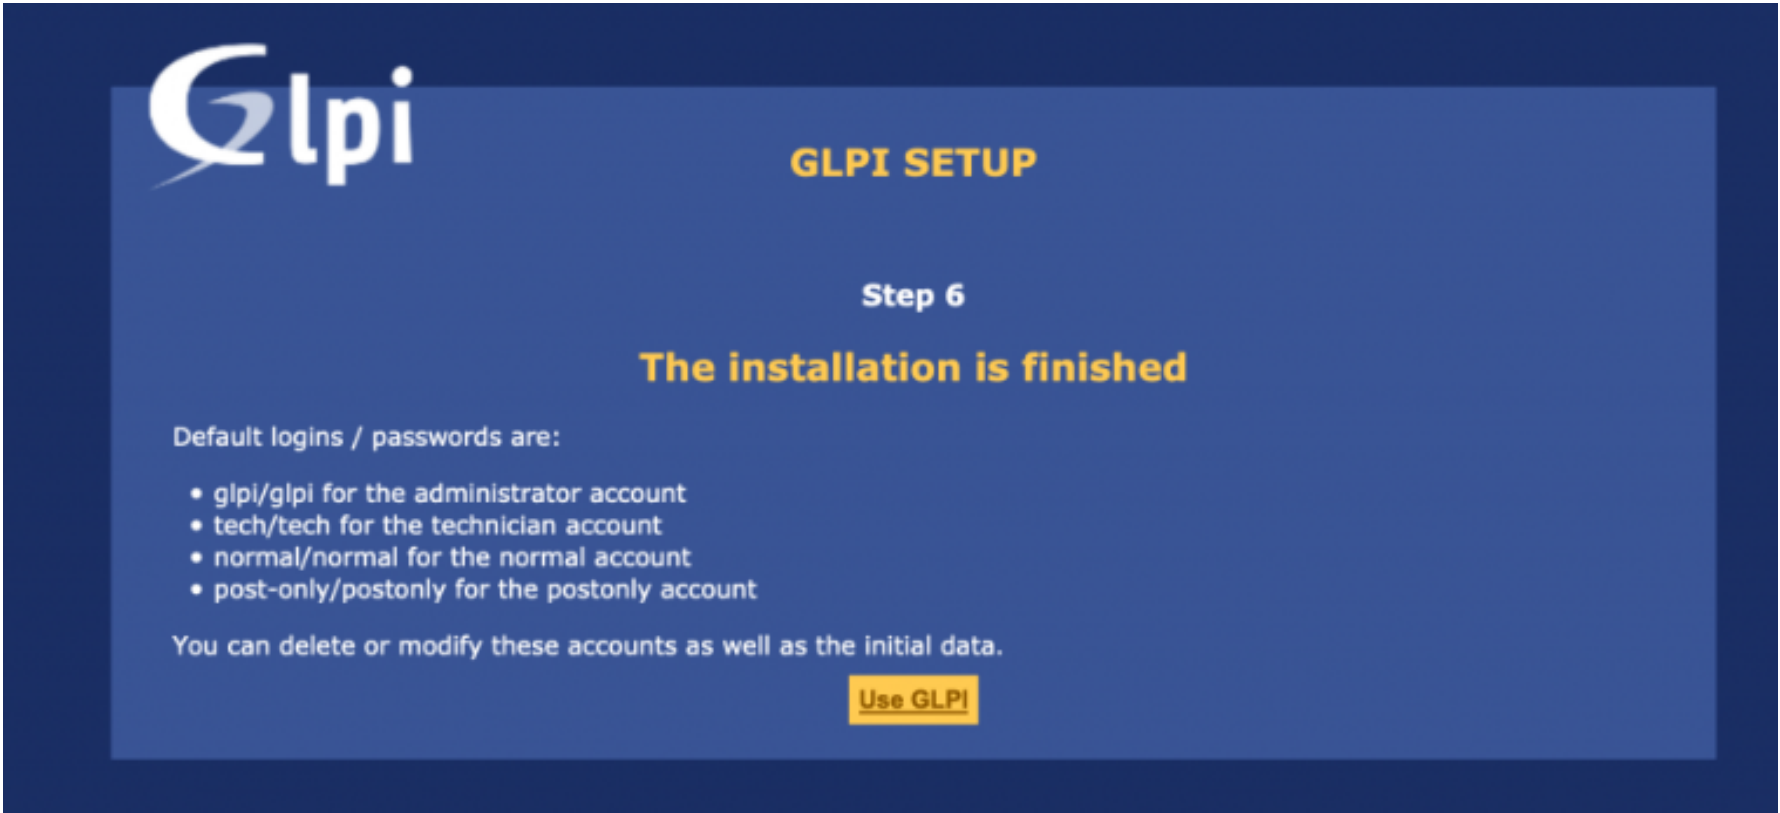

Then you can choose whether or not you want to send usage statistics to GLPI.

The installation is complete, click on continue then use GLPI

For the first connection, the username is : glpi and the password is : glpi.

And here you are on GLPI 10!

All that remains is to change the default user passwords for the first error displayed.

For the second, just delete the installation folder on the server:

```
rm -fr /var/www/html/glpi/install
```
